MARPAT 139:48560

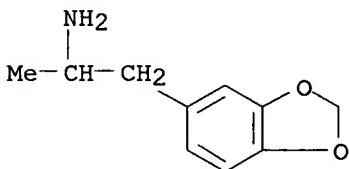

AB The present invention describes a hapten derivatized with a crosslinker at the N-position of 3,4-methylenedioxymethamphetamine (MDMA). The present invention provides an immunogen comprising the aforementioned hapten, coupled to an antigenicity-conferring carrier material, as well as, conjugates comprising the aforementioned hapten covalently bonded to a detectable labeling agent. In addition, the present invention concerns antibodies raised against the aforementioned immunogens. Finally, the present invention relates to methods and kits for detecting or determining MDMA and N-alkylated derivs. of methylenedioxymethamphetamine in biol. fluids. The antibodies of the present invention do not significantly cross-react with amphetamine and methamphetamine. Haptens and immunogens and horseradish peroxidase-labeled hapten reagents were prepared from (3,4-methylenedioxymethamphetamine)phenylacetic acid for the development of competitive ELISAs for MDMA.

MARPAT 136:162629

AB The present invention provides a system for the improved **detection** of **ecstasy**-class compds. in biol. samples. New **ecstasy**-class analogs are provided for **detection** of such **ecstasy**-class drugs. These analogs are compds. or salts thereof, of a 2-amino-methylenedioxophenyl derivative attached to Z, where Z is a moiety capable of bonding, either directly or indirectly, with an immunogenic carrier, a **detectable label**, or a solid capture vehicle. Such analogs may be used to construct **immunogens**, enzyme or enzyme-donor conjugates, and other conjugates. The **immunogens** reproducible generate **antibodies** with an exquisite ability to distinguish various **ecstasy**-class drugs in biol. samples from potentially interfering substances. The specific **antibodies** and conjugates may be used to distinguish and measure various **ecstasy**-class compds. in biol. samples, such as those obtained from an individual suspected of substance abuse. In another aspect, the invention includes certain reagents, reagent combinations, and kits for performing assay methods for **ecstasy**-class compds. in a biol. sample.

AB A dual analyte immunoassay for the **detection of amphetamine and methamphetamine** is provided in which only one labeled binding partner is used which can interact with the combination of **antibodies** and their corresponding analytes **detecting** the presence of the analytes either alone or in combination. The binding partner is a labeled derivative of one of the analytes capable of binding to both **antibodies** with different affinity. Preparation of an amphetamine derivative **label**, a BSA conjugate, and microparticles sensitized with the conjugate are described. A standard curve for the assay is included, as are cross-reactivity data for **amphetamine-related drugs**.

AB The present invention is directed to a fluorescence polarization assay for phenylcyclidine and phenylcyclidine derivs., to the various components needed for preparing and carrying out such an assay, and to methods of making these components. Specifically, tracers, **immunogens** and (monoclonal) **antibodies** are disclosed, as well as methods for making them, and a reagent kit containing them. The tracers and the

immunogens are made from substituted phencyclidine compds. A fluorescein moiety is included in the tracer, while a poly(amino acid) forms a part of the **immunogen**. The assay is conducted by measuring the degree of polarization retention of plane polarized light that has been passed through a sample containing antiserum and tracer. The assay has a high degree of specificity for phencyclidine and metabolites and analogs thereof, while minimizing mass reactivity to a host of other synthetic metabolites and naturally occurring compds.

OTHER SOURCE(S): MARPAT 115:177279

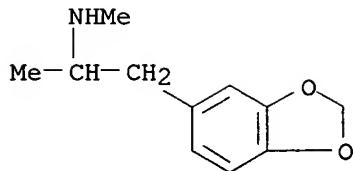

AB A fluorescence polarization immunoassay (FPIA) for detecting the presence of ≥ 1 amphetamine-class analytes in a test sample is provided. The immunoassay uses competition between the analyte and a fluorescently labeled tracer for the binding site on an antibody specific for phenethylamine derivs. The concentration of amphetamine-class analyte in the sample dets. the amount of tracer that binds to the antibody. The amount of tracer/antibody complex formed can be quant. measured and is inversely proportional to the quantity of analyte in the test sample. Also provided are tracers, immunogens used to elicit antibodies for use as assay reagents, and assay kits incorporating these tracers and assay reagents. Thus, N-tert-butoxycarbonyl-N-carboethoxymethyl-d,l-amphetamine was prepared and used to prepare a N-carboxymethyl-d,l-amphetamine-albumin conjugate for use as immunogen. Synthesis of N-acetamidomethylfluorescein-d,l-amphetamine for use as a tracer is described, as is preparation of other tracers and immunogenic conjugates. The FPIA and reagents of the invention had sufficient cross-reactivity to detect amphetamine-class drugs at concns. which produce a stimulating or toxic effect. At the same time, concns. of phenethylamine-like substances common in certain foods (e.g. tryptamine and tyramine) were not readily detected. Pretreatment of test samples with riboflavin-binding protein decreased the background intensity of the samples.

* STRUCTURE DIAGRAM TOO LARGE FOR DISPLAY - AVAILABLE VIA OFFLINE PRINT *

AB The title method, reagents, and tracers are used for determining amphetamine (I) and d-methamphetamine (II) in a biol. fluid, e.g. urine. The method can also detect certain "designer drugs", e.g. 3,4-methylenedioxymethamphetamine. An improved

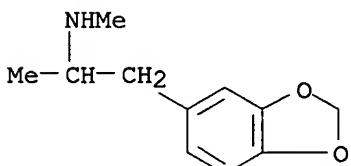

fluorescence polarization immunoassay is provided for determining I and II in a single assay. The procedure includes pretreatment of the biol. sample with (1) aqueous IO₄⁻ solution to eliminate cross-reactants, e.g. hydroxyphenethylamine, and (2) riboflavin-binding protein to reduce fluorescence interference from riboflavin. Also provided are tracer compds., e.g. III (Q = fluorescein or fluorescein derivative; Z = NH, CO, SO₂; R = linking group including ≤5 heteroatoms and a total of 0-15 C atoms and heteroatoms); preparation of the tracer compds. is described. An automatic assay apparatus and kit for performing the method of the invention are also described, as is the preparation of immunogens for production of antibodies for the immunoassay. Thus, tracers IV and V were prepared and used in an immunoassay for determination of I and II. Cross-reactivity of the immunoassay for tyramine was apprx. 0.4% and for l-methamphetamine was <5%.
